```

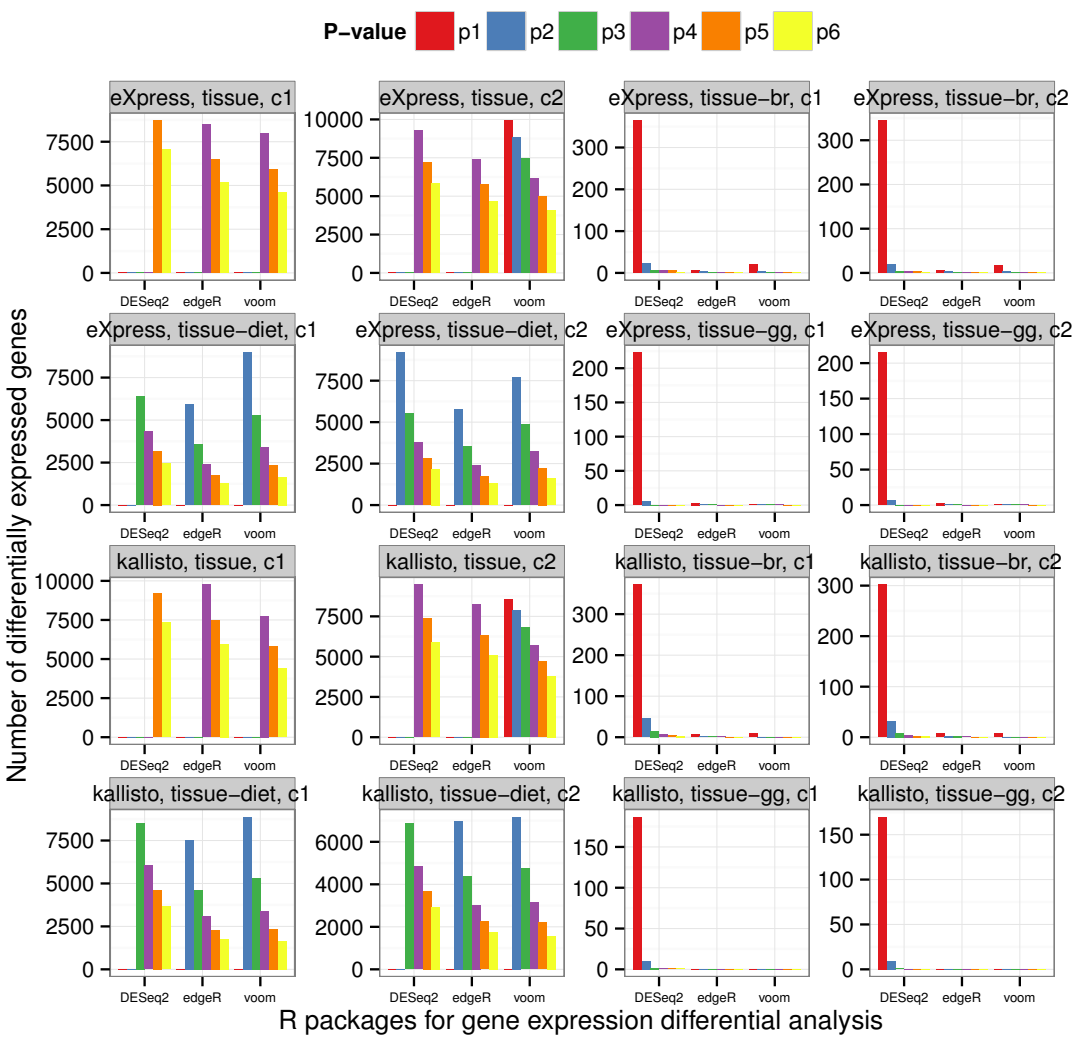
Load packages.

```
pkgs <- c('xlsx','caret','leaps','glmnet','lattice',
          'latticeExtra', 'dplyr', 'tidyr')
lapply(pkgs, require, character.only = TRUE)
```

1 Differentially expressed genes

Differentially expressed genes are counted from mapping **both gills and ganglia** sequenced samples to reference transcriptome built from all samples.

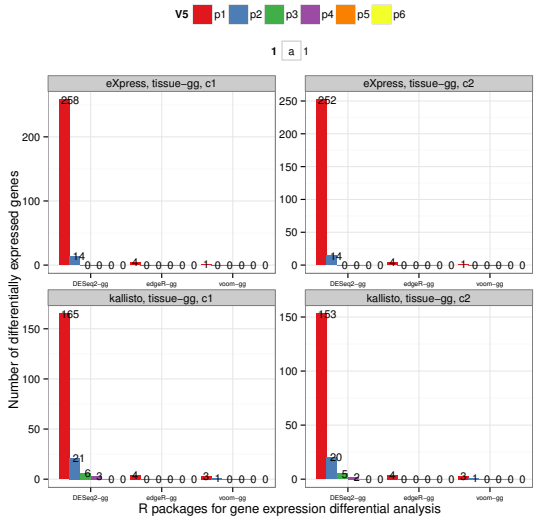
```
read.table("./data/summary.raw.all.txt") %>%
    ggplot(aes(
        x = V1,
        y = V8,
        fill = V6)) +
    theme_bw() +
    geom_bar(stat = "identity",
             position = "dodge") +
    facet_wrap(~ V4 + V5 + V7,
               ncol = 4,
               scales = "free") +
    scale_fill_brewer(type = "qual", palette = 6,
                      name = "P-value") +
    labs(x = "R packages for gene expression differential analysis",
         y = "Number of differentially expressed genes") +
    theme(legend.position = "top",
          axis.text.x = element_text(vjust = .5,
                                     size = 6))
```



Differentially expressed genes are counted from mapping **gills** sequenced samples to reference transcriptome built from all samples.

```
read.table("./data/summary.gg.txt") %>%
```

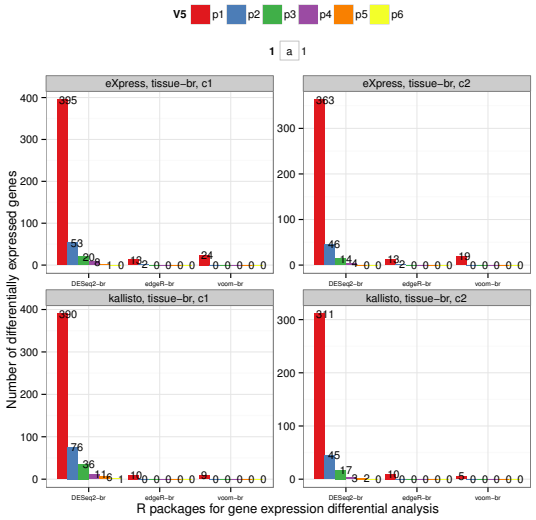
```
    ggplot(aes(
    x = V2,
    y = V8,
    fill = V5)) +
    geom_bar(stat = "identity",
             position = "dodge") +
    geom_text(aes(x = V2,
                  y = V8,
                  ymax = V8,
                  label = V8,
                  size = 1,
                  hjust = 0),
              position = position_dodge(width = 1)) +
    facet_wrap(~ V3 + V4 + V6,
               ncol = 2,
               scales = "free") +
    scale_fill_brewer(type = "qual", palette = 6) +
    theme_bw() +
    theme(legend.position = "top",
          axis.text.x = element_text(vjust = .5,
                                     size = 6)) +
    labs(x = "R packages for gene expression differential analysis",
         y = "Number of differentially expressed genes")
```



Differentially expressed genes are counted from mapping **ganglia** sequenced samples to reference transcriptome built from all samples.

```
read.table("./data/summary.br.txt") %>%
```

```
    ggplot(aes(
    x = V2,
    y = V8,
    fill = V5)) +
    geom_bar(stat = "identity",
             position = "dodge") +
    geom_text(aes(x = V2,
                  y = V8,
                  ymax = V8,
                  label = V8,
                  size = 1,
                  hjust = 0),
              position = position_dodge(width = 1)) +
    facet_wrap(~ V3 + V4 + V6,
               ncol = 2,
               scales = "free") +
    scale_fill_brewer(type = "qual", palette = 6) +
    theme_bw() +
    theme(legend.position = "top",
          axis.text.x = element_text(vjust = .5,
                                     size = 6)) +
    labs(x = "R packages for gene expression differential analysis",
         y = "Number of differentially expressed genes")
```



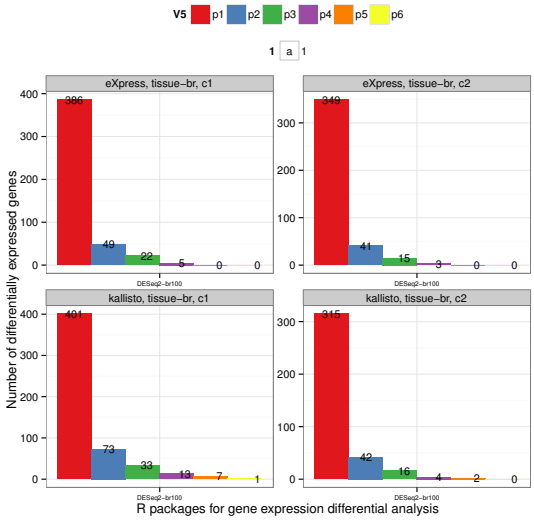
1.1 Increasing DEG by changing the trimming rates of raw reads

Getting gene expression by mapping the original raw reads **without trimming** to the **gills** de novo transcriptome.

↰ De novo assembly was carried out with trimmed reads though

```
read.table("./data/summary.br_35078.txt") %>%
```

```
    ggplot(aes(
    x = V2,
    y = V8,
    fill = V5)) +
    geom_bar(stat = "identity",
             position = "dodge") +
    geom_text(aes(x = V2,
                  y = V8,
                  ymax = V8,
                  label = V8,
                  size = 1,
                  hjust = 0),
              position = position_dodge(width = 1)) +
    facet_wrap(~ V3 + V4 + V6,
               ncol = 2,
               scales = "free") +
    scale_fill_brewer(type = "qual", palette = 6) +
    theme_bw() +
    theme(legend.position = "top",
          axis.text.x = element_text(vjust = .5,
                                     size = 6)) +
    labs(x = "R packages for gene expression differential analysis",
         y = "Number of differentially expressed genes")
```

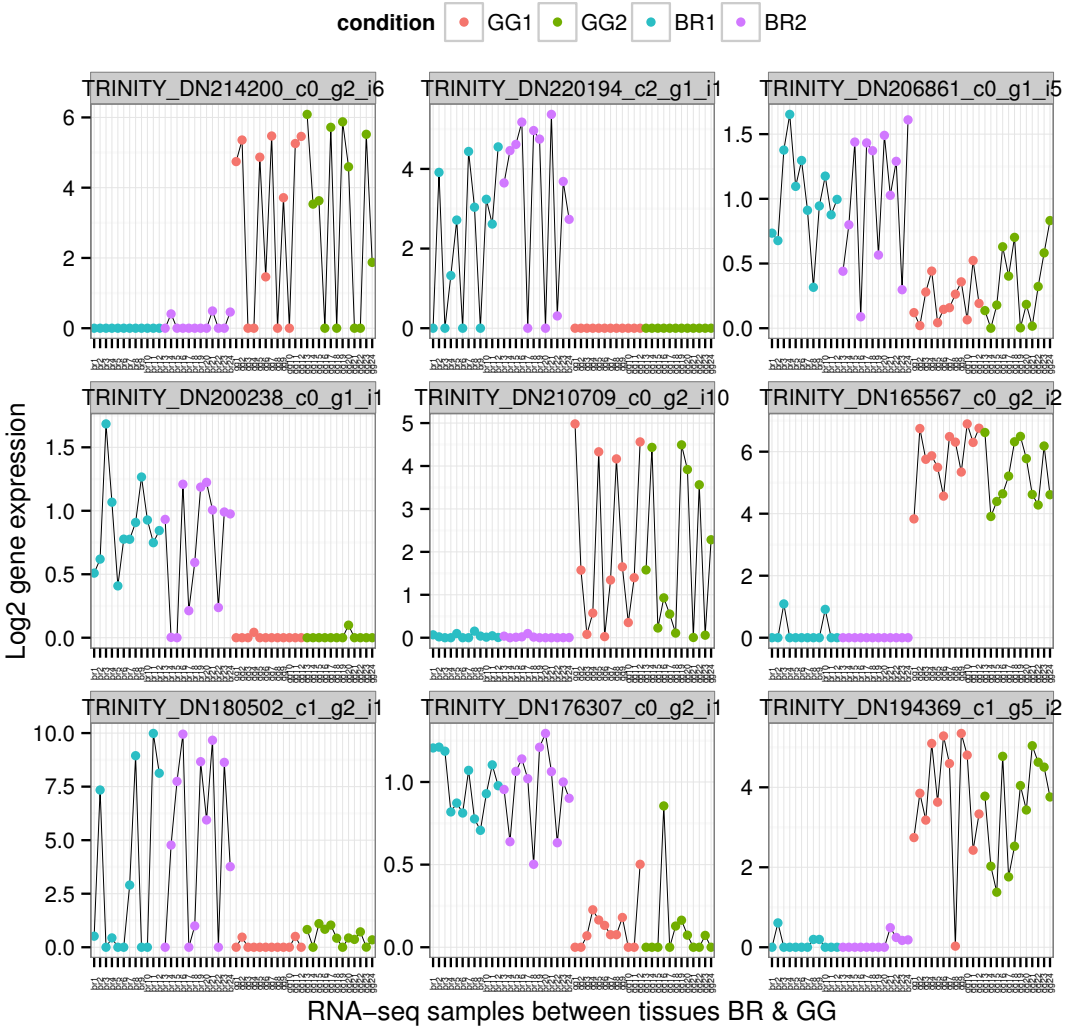


2 A linear representation of gene expression

Only selected genes can be represented as follow.

```
dat <- t(read.table("./data/test.txt"))
```

```
dat <- data.frame(dat,
                  sample = rownames(dat),
                  condition = gl(4,12,48,
                    labels=c("GG1","GG2","BR1","BR2")))
dat %>%
    gather("genes","expression",1:(dim(dat)[2]-2)) %>%
    ggplot(aes(x = factor(sample,
                          c(paste("br",seq(1,24),sep=""),
                            paste("gg",seq(1,24),sep="")))),
               y = expression,
               group = condition)) +
    theme_bw() +
    geom_line(size = .2) +
    geom_point(aes(x = factor(sample),
                   y = expression,
                   colour = condition)) +
    facet_wrap(~ genes,
               ncol = 3,
               scales = "free") +
    labs(x = "RNA-seq samples between tissues BR & GG",
         y = "Log2 gene expression") +
    theme(legend.position = "top",
          axis.text.x = element_text(angle = 90,
                                     vjust = .5,
                                     size = 4)) +
    scale_fill_brewer(type = "qual", palette = 6,
                      name = "Oyster tissues and Diet conditions")
```



3 System Information

The version number of R and packages loaded for generating the vignette were:

```
###save(list=ls(pattern=".*|.*"),file="PD.Rdata")
```

```
sessionInfo()
